

# Cropping Systems Coordinated Agricultural Project: Extended Rotations

Joe Lauer, Emerson Nafziger, Maciej Kazula, Maria Villamil, Gevan Behnke, and Thierno Diallo

University of Wisconsin and University of Illinois

Iowa State University, Ames, IA

August 5-7, 2014

This research is part of a regional collaborative project supported by the USDA-NIFA, Award No. 2011-68002-30190: Cropping Systems Coordinated Agricultural Project: Climate Change, Mitigation, and Adaptation in Corn-based Cropping Systems. Project Web site: [sustainablecorn.org](http://sustainablecorn.org)

# Crop rotation plan for Monticello

Potatoes	Wheat	Pease	Rye			
Wheat	Turnips	Rye	Clover	Clover	Clover	
Pease	Wheat	Potatoes	Rye			
Wheat	Turnips	Rye	Clover	Clover	Clover	
Corn	Wheat	Potatoes	Rye			
Pease	Wheat	Potatoes	Rye			
Wheat	Turnips	Rye	Clover	Clover	Clover	

Pease coming off earlier than Potatoes would perhaps be the best crop to precede Wheat.

The Advantage of a Crop of turnips sown on the Wheat stubble and folded off with Sheep must be very great and one that cannot be had in Europe as the harvest is too late there to put in turnips on the stubble. Turnips are known to succeed well sown on stubble without having. the stubble keeps the land light & gives room for the turnips to grow

In the 3<sup>d</sup> Scheme the Corn should be sown in drills of 7 feet wide and one foot in the Row it may be overworked over 2 times before the pease are sown <sup>which</sup> should not be till June which is the best time for planting potatoes

42261

- Thomas Jefferson used a scientific approach to farming
  - ✓ Carefully considered a workable method of crop rotation for Monticello
  - ✓ An innovative practice at the time
- The corn-soybean system of the U.S. Corn Belt is a relatively young cropping system.
  - ✓ Currently challenged by many abiotic and biotic factors
  - ✓ Is it sustainable?

# Overview

- Objective: To compare GHG emissions of extended crop rotations.
- What are we looking for?
  - ✓ What is the experimental unit?
  - ✓ How can we tell if change is occurring?
- Crop Rotation
  - ✓ The control (Corn-Soybean)
  - ✓ Options (CC, CCS, etc.)
  - ✓ Extended – Adding a third crop (CSW)
- GHG Emissions
- Soil changes

# Cumulative N<sub>2</sub>O and CO<sub>2</sub> emissions at three locations in Wisconsin

# Seasonal Distribution N<sub>2</sub>O and CO<sub>2</sub> emissions at Monmouth, IL and three locations in WI

# Water retention curves at Arlington.

# Summary

- Modern corn hybrids and management practices have the same rotation response as older hybrids and practices.
- The rotation effect lasts at most two years increasing grain yield 10 to 19% for 1C and 0 to 7% for 2C.
- At least two break years are needed to measure a response in the second continuous cropping year.
  - ✓ A one year break using soybean reduces the rotation effect in the second continuous year.
- Tillage does not affect corn yield the first year following soybean, but improves yield 5% in the second year, and 9% in the third year.
- The addition of other crops to the rotation can improve grain yield of all crops.
  - ✓ Prudent thing to do
- Greenhouse gas emissions can be mitigated by extended crop rotations.
- The “rotation effect” is probably unique from field to field.
- Long-term rotation experiments are giving us a preview of crop rotation responses in the future.
  - ✓ Allows faster development and formulation of producer recommendations

The End For Now – Questions?  
Thanks for your attention!
